

Leaving Edmonds, WA., for Kingston, WA., a ferry both reports and receives weather data every 15 seconds while underway.

CSI on deck means real-time reports for the Washington State Ferry System

Sound monitoring: Mobile weather stations provide data to the public

The Washington State Ferry System (WSF) is the largest ferry system in the United States. The 29-vessel fleet makes over 500 trips per day, facilitating transportation of commuters, tourists, vehicles, and goods to islands and peninsulas throughout Puget Sound. Weather systems in the area move from the Pacific Ocean across western Washington, with wind speed and direction on the waters of Puget Sound being influenced by the Olympic and Cascade mountain ranges. Surface winds are often deflected or funneled contrary to the barometric flow of the systems. Personal observations of pilots, Washington State Ferry captains, and

other mariners have shown weather conditions on the Sound to be vastly different, at times, from those being recorded by National Oceanic and Atmospheric Administration (NOAA) shoreside sensors, and by four buoy stations in the area operated by the National Weather Service. In an effort to make meteorological data from the Sound available to the public, the Washington State Department of Transportation funded the installation of weather stations on seven of the ferries. The stations measure meteorological parameters along the ferry routes and provide ferry operators and the general public with

APPLICATION AT A GLANCE

Application type:
Meteorological Monitoring

Project area:
Puget Sound

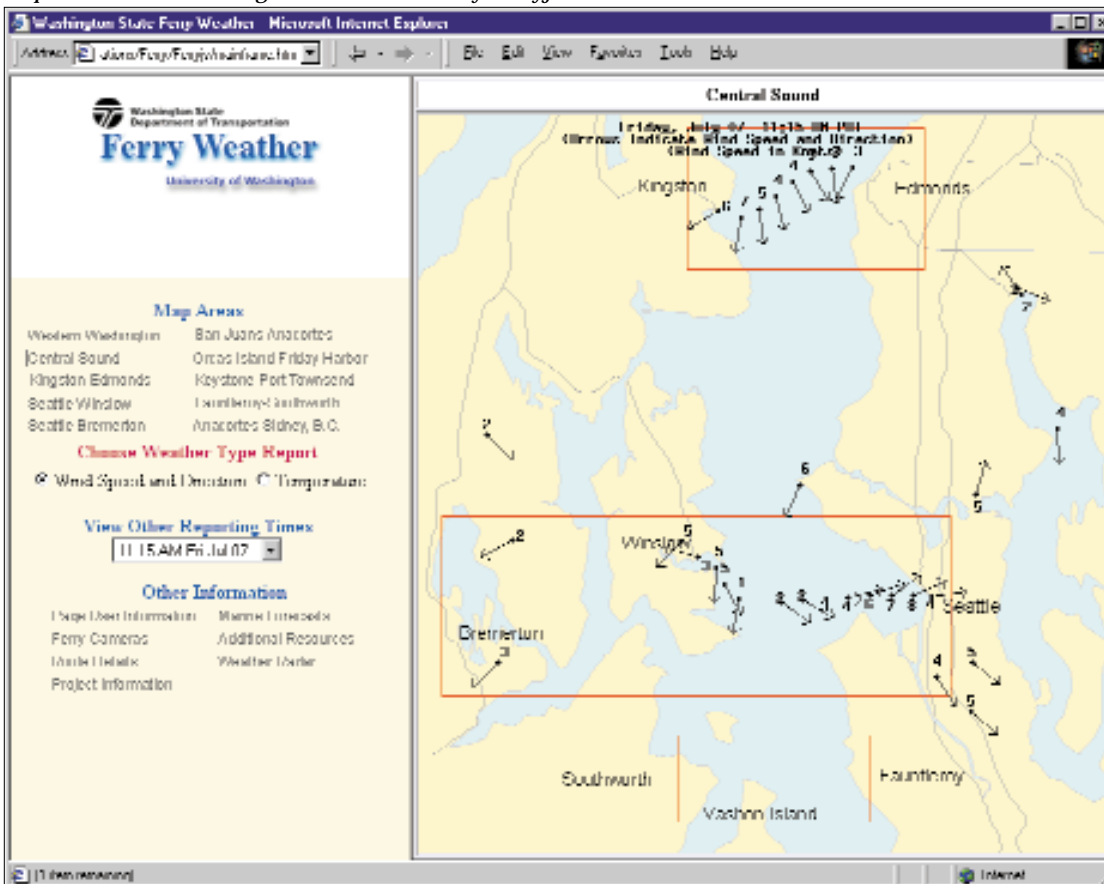

Contracting agencies:
University of Washington and Washington State Department of Transportation

Datalogger(s):
Campbell Scientific CR10(X)s

Communication links:
Meteor Communications Corp's MCC-545A RF modem (meteor burst and ELOS)

Measured parameters:
Wind speed and direction, barometric pressure, temperature, and relative humidity

The Washington State Department of Transportation, in conjunction with the University of Washington, posts data from the ferries on its web site (see address above) in near real-time. Arrows indicate wind direction and speed (in knots).

Continued from front

data for more accurate weather reports and forecasts. The stations provide meteorological data where such data was previously unavailable due, in part, to the unique geographic and environmental features of the region.

In 1995, The University of Washington, School of Marine Affairs established the Smart Forum, instituting a means for federal, state, and local regulators to exchange information with marine operators, managers and the general public about safe marine transportation in Puget Sound. The involvement of Campbell Scientific, Inc., in placing weather stations on the ferries, was a direct result of the Smart Forum.

The weather stations were integrated into the already existing Fleet Location System (FLS), a real-time ferry tracking system used by the WFS to maintain the exact locations of each ferry and coordinate scheduling. Meteor Communications Corporation (MCC) provided the FLS with Campbell Scientific equipment and in turn integrated the weather stations into

the FLS systems of the ferries.

Each station consists of a CR10X datalogger which measures air temperature, barometric pressure, relative humidity, and wind speed and direction sensors. A Global Positioning System (GPS) provides global position coordinates, vessel speed over ground and course over ground. A gyrocompass (GYRO) provides the actual vessel heading. Data from the GPS, GYRO and CR10X are input to a MCC-545A RF modem, which corrects the measured wind speed and direction using the vessel speed, heading and course over ground. The RF modem outputs the corrected wind speed and direction back to the CR10X for display on the panel, then transmits a data report. The data are displayed to the ferry captain on the vessel itself through use of an LED display panel interfaced to the CR10X. Data are also delivered to a Washington State Ferry workstation, and are available for dissemination to the NWS and the University of Washington, in addition to being posted to the Washington State Ferry web page for public use.

During periods of high winds and max-

imum tidal currents, some ferries are prevented from safely landing at, or departing from, their terminal slips. With a single delay causing dramatic concern for thousands of commuters, the installation of weather stations on some ferries and transmission of the subsequent real-time data fills a critical gap in the ever-changing puzzle that is Puget Sound weather.
